

Signs Of A Faulty Heater

Here we explain you some signs of a faulty heater. With the help of these signs, you can identify that your heating system is working properly or not.

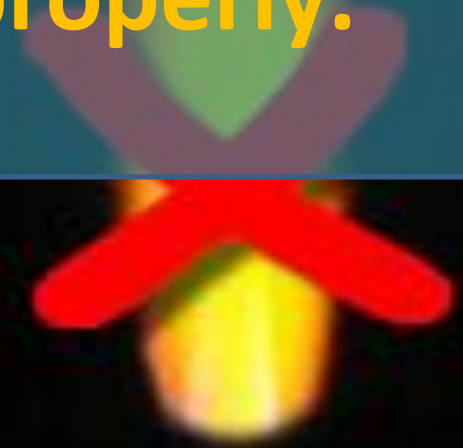

Check if the outer casing is discoloured or is there any soot stains? This might be the symptom of a faulty flue.

The pilot light 'pops' when lighting or goes out unexpectedly.

If a yellow flame appeared in the heater, it indicates that the heater is not working properly.

**The wall shouldn't be too hot
when it is touched.**

A photograph of a white Carrier outdoor furnace unit. The unit is rectangular with a large circular fan grille on top and a large rectangular grille on the front. It is mounted on a concrete pad. A semi-transparent blue box with a dark blue border is overlaid on the front of the unit, containing yellow text. The background shows a light green stucco wall and some outdoor landscaping.

An unusual smell or a noisy fan operation indicates a faulty heater.

Thank You
